Increasing adherence to COVID-19 guidelines: Lessons from existing evidence

Pascaline Dupas, Stanford University, J-PAL Health Sector Co-Chair
Karen Macours, Paris School of Economics, J-PAL Health Sector Co-Chair

April 15, 2020 | World Bank Human Development Chief Economist Office
Motivation

• Many governments are advising residents to socially distance themselves, wash their hands regularly, and take various actions to protect themselves and others against COVID-19. Adherence to these guidelines is a critical factor in the fight against the pandemic.

• Evidence from rigorous research can help to inform government actions to ensure high adherence
  – Most evidence does not come from pandemic situations; it is possible that not everything will generalize to crisis situations
  – Non-adherence could be for several reasons, particularly important are information barriers, financial barriers, trust barriers

• Goal today is to provide some general lessons on increasing uptake of healthy behaviors and on improving the delivery of health products and services in order to respond to the COVID-19 pandemic.
Recommendations for increasing adherence to COVID-19 guidelines

**Strengthen information campaigns**
- Provide **specific** and **actionable** information
- Leverage influence of **well-connected community members and peers** (while avoiding face-to-face interactions)
- Incorporate key public health messages into **new or existing entertainment media**
- Educate **celebrities** and leverage their voices

**Develop new or leverage existing cash transfer programs**

**Ensure widespread access to and trust in health products and services**
- **Subsidize recommended preventive health products** and eliminate user fees if possible
- Incorporate programs or policies that **improve trust in the health system**
Information campaigns
Information Campaigns

In the context of COVID-19:

- **Salience does not seem to be a problem in many contexts**
  - e.g. GeoPoll 2020 in Nigeria, South Africa, and Kenya
  - In countries where political leadership is dismissing the threat, salience may be reduced

- **Clear understanding of benefits requires clear messaging**
  - Emphasize the benefits rather than simply exhort people to change behavior

- **Information alone is limited in contexts where people lack access** to clean water or sanitation services or when people are facing serious economic shocks, among other constraints
  - Potential complementarities with cash transfers; importance of social protection programs
Well-designed information campaigns can increase adherence

Simply urging people to change behavior usually does not work. **Information is often impactful** in changing behavior when it is **specific and actionable**.

- Evidence from Bangladesh, Cameroon, Guatemala, India, Kenya, Malawi, Peru, Uganda, and USA
- Covers a range of health topics, including sexual behavior, take-up of preventive health products, insurance, handwashing, and more

**COVID-19 Application: Specific and actionable information campaigns to encourage key preventive health behaviors**

- Behaviors include hand washing, social distancing, wearing masks
- E.g., advice to systematically wash hands upon returning from the grocery store or to set an alarm to remember to wash hands every 2 hours may be more effective than more general exhortation to “wash hands regularly.”

Galiani et al. 2015; Bennear et al. 2013; Dupas 2011; Dupas et al. 2018; Maughan-Brown et al. 2015; Meredith et al. 2013; Kling et al. 2012
Leveraging the influence of peer networks such as friends and neighbors can motivate uptake

A large body of evidence from around the world shows that peers & community members can influence behavior

• In India, well-connected individuals in a community were particularly effective at spreading important information on immunization and increasing immunization coverage. Two RCTs demonstrate that community members can reliably and easily identify well-connected individuals.

• Evidence on peer influence from several countries and contexts:
  – Uptake of menstrual cups leveraging classmates in Nepal
  – Peer referrals for TB screening in India
  – Uptake of bednets leveraging neighbors in Kenya
  – Uptake of HIV testing leveraging neighbors in Malawi
  – Uptake of non-traditional cookstoves leveraging community “opinion leaders” in Bangladesh

Leveraging the influence of peer networks such as friends and neighbors can motivate uptake

COVID-19 Application: Directly leveraging the influence of well-connected community members and peers (while avoiding face-to-face interactions) may help to spread accurate information on new recommendations and encourage adherence.

• While guidelines on social distancing make in-person interactions difficult, online and mobile platforms may be good ways to leverage this influence.
• Policymakers may be able to ask community members to identify well-connected individuals without social network data
  – However, it is unclear how information diffusion through these well-connected individuals may be impacted during a crisis
Edutainment may be a promising delivery method for key public health messages

- Television, radio, or other entertainment platforms can **change attitudes and behaviors by embedding educational messages** in a bigger storyline.

- Nigerian TV series *MTV Shuga* fused sexual health messaging with engaging storylines.
  - **Improved knowledge and attitudes** towards HIV and risky sexual behavior & increased HIV testing.
  - Effects were **stronger for viewers who reported being more involved** with the story or identified with the characters.

*Banerjee et al. 2019; Banerjee et al. 2016; Green et al. 2018*
Edutainment may be a promising delivery method for key public health messages

COVID-19 Application: Where possible, incorporating key public health messages into entertainment media could help improve adherence to recommended behaviors.

- Could cover topics such as social distancing and hand washing
- Animation or actors filming themselves from home could potentially ease constraints to producing material while abiding by social distancing
Engaging celebrities in sharing key health messages can increase the reach of these messages

In Indonesia, celebrity endorsement significantly increased the likelihood that a tweet promoting immunization was liked or retweeted relative to similar tweets without celebrity endorsement.

- 79 percent of the celebrity effect comes from the act of celebrity authorship itself, rather than merely passing on a message
- By contrast, explicitly citing sources in the tweets actually reduced diffusion

**COVID-19 Application:** Educating celebrities early on in an epidemic and leveraging their voices can help to avoid the spread of misinformation or the undermining of public health campaigns.

- Celebrities can have a positive or negative impact on public opinion and behavior depending on the content and accuracy of their message
- Celebrity influence may continue to be important for raising the profile of COVID-19 in the medium-term when salience of the health threat is lower
Insights for programming

Information campaigns should **make advice specific and actionable** (e.g. advice to systematically wash hands upon returning from the grocery store may be more effective than more general exhortation to “wash hands regularly”)

Consider incorporating **messages from those with whom target audience is likely to feel a connection** (e.g. peers, TV characters, etc.). Given social distancing guidelines and lockdowns, are there **social media or other online platforms** to leverage?

Consider incorporating **educational messages into popular entertainment** (TV, radio, etc.)
Insights for programming

Consider **educating celebrities** early on in an epidemic and leveraging their voices. Celebrity influence may continue to be **important for raising the profile of COVID-19 in the medium-term**

Reminder that **information campaigns can be effective for overcoming lack of awareness, procrastination, or other behavioral biases**. They cannot overcome inability to take up recommended behaviors (e.g. if someone cannot practice social distancing due to financial constraints)
Cash transfers
Cash transfers can act as both income support and encourage uptake of healthy behaviors

- Large body of evidence on **cash transfers changing uptake of healthy behaviors** (preventive health care visits, child vaccinations, improved nutrition)
- COVID-19 emergency response often **includes expansion of cash transfers**
- Cash transfers can be:
  - Unconditional,
  - Unconditional, but accompanied by specific and actionable information
  - Conditional, but with a “soft” or unenforced condition
  - Conditional with a “hard” or enforced condition
- Choice of transfer **depends on outcomes of interest and the relative costs and benefits** of each type of transfer

For a J-PAL review of the evidence on the impact of cash transfers on health, please reach out to Anupama Dathan (adathan@povertyactionlab.org)

Cash transfers can act as both income support and encourage uptake of healthy behaviors

- Transfers **requiring certain conditions** on healthy behavior usually **increase adoption** of those behaviors
  - If condition is soft, **uptake may still increase if households become aware of the importance** of such behaviors and there is an implication that the transfer should be used for them
  - Evidence shows **labeling/social marketing can be important** for changing behavior

- Transfers with **no conditions** or information provision **increase spending on household priorities** and often improves overall household well-being
  - Improved health outcomes are often difficult to detect

For a J-PAL review of the evidence on the impact of cash transfers on health, please reach out to Anupama Dathan (adathan@povertyactionlab.org)
CCTs and UCTs provide income support but can also be leveraged to increase uptake of healthy behaviors. Decisions on which to adopt may depend on the outcome(s) of interest, as well as the relative costs and benefits of each type of transfer.

If the goal is to increase adoption of healthy behaviors while providing income support, some type of condition (soft or hard) or information provision is important. Implementation of hard conditions will take time. Given the urgency of COVID-19, the cost of this should be weighted against the potential for increased adherence to COVID-19 guidelines.

If implementing a cash transfer, conditional or otherwise, consider leveraging any infrastructure from existing transfer programs and expanding them as needed to expedite the process.
Improving the delivery of health products and services
Charging fees for many key preventive health products dramatically reduces take-up

- Deworming, Kenya 1
- Bednets in Clinics, Kenya 2
- Soap, India 4
- Water Disinfectant, Zambia 3
- Water Disinfectant, Kenya 5
- Bednet Vouchers, Kenya 6

People are just as likely to use free products as they are products they paid for.
Insights for programming

To increase mass uptake of recommended preventive products such as masks, COVID-19 tests, soap for handwashing, etc., governments should consider subsidizing preventive health products and eliminating user fees.

However, supply-side constraints must be eased before free provision.

What products are provided for free will depend on national and local guidelines.
Increased trust in the health system may be critical for more community cooperation with health guidelines

- Programs or policies that increase trust in the health system could improve cooperation with health guidelines. This in turn could help increase testing, reduce the spread of the disease, and reduce mortality.
  - In Sierra Leone during the Ebola crisis, community monitoring of government-run health clinics and status awards for clinic staff (both implemented roughly two years prior to the Ebola health crisis) improved the community’s perception of health care quality.
    - During the crisis, the interventions increased Ebola testing rates and reduced patient mortality.
  - In the United States, black men (typically more mistrustful of the health care system) were more likely to trust providers of the same race. Seeing doctors they trusted increased their preventive health care utilization rate, including receiving the seasonal flu vaccine.

Christensen et al. 2020; Alsan et al. 2019
Insights for programming

In instances where marginalized groups may be less willing to visit health centers due to fear of discrimination, trust-building policies such as assurances of privacy, the ability to see health providers from the same race, implementation of accountability mechanisms, etc. may reduce mistrust.

Marginalized groups and policies will differ by context. For instance, in areas with low baseline quality of care, community monitoring may help. In locations with a history of discrimination against certain ethnic or racial groups, access to health care workers from that group may be effective.

In the longer run, increased trust may make health systems more resilient by increasing adherence to recommended guidelines and key preventive behaviors during health crises.
Recommendations for increasing adherence to COVID-19 guidelines

Strengthen information campaigns

- Provide **specific** and **actionable** information
- Leverage influence of **well-connected community members and peers** (while avoiding face-to-face interactions)
- Incorporate key public health messages into **new or existing entertainment media**
- Educate **celebrities** and leverage their voices

Develop new or leverage existing cash transfer programs

Ensure widespread access to and trust in health products and services

- **Subsidize recommended preventive health products** and eliminate user fees if possible
- Incorporate programs or policies that **improve trust in the health system**
**Next Steps**

**Next steps:** J-PAL researchers and staff ready to help World Bank TTLs think about adapting the lessons from this evidence to local contexts.

- Reach out to HDCE team and J-PAL to coordinate follow-up discussions
